

Memory Keepers

Google Cloud architecture. Product names and icons follow the Google Cloud icon library. One Cloud Run service holds the island and the agents. Firestore is the only store. Dreaming arrives through Pub/Sub, published by Cloud Scheduler, tired keepers, and the Dreaming button.

REQUEST PATH

inside the Cloud Run service

Requirements coverage

Mapped to the live Devpost page (What to Build, What to Submit, Judging Criteria, Bonus Points). Nothing here is claimed that the repo does not do.

MANDATORY TECHNOLOGY (EVERY PROJECT, EVERY TRACK)

RULE	STATUS	HOW THIS PROJECT MEETS IT
Gemini 3.5 or newer, Gemini API or Vertex AI	Covered	Gemini 3.5 Flash on Vertex AI, global endpoint. Env GEMINI_MODEL, GOOGLE_GENAI_USE_VERTEXAI=TRUE. Cloud is the hosted brain.
At least one Google Agent Framework: ADK, GenAI SDK, Antigravity SDK, or GenKit	Covered	Google ADK (Python): monument root, per-keeper AgentTool, ridge and dream agents. GenAI SDK types carry the runner messages.
At least one Google Cloud infrastructure service (Cloud Run, Cloud SQL, Firestore, GKE, or Pub/Sub)	Covered	Cloud Run, Firestore, and Pub/Sub. Also Cloud Scheduler, Cloud Text-to-Speech, Cloud Speech-to-Text, Cloud Build. One required, several in production.

TRACK: THE COLLABORATIVE PARTNER

TRACK ASK	STATUS	WHERE IT LIVES
Interactive expert that guides, asks, and remembers	Covered	Each keeper is an expert on one life layer. Ask is grounded in opened books. Ridge keepers ask one real question. Monument routes across shelves.
Gets better every time it is used	Covered	Every tell writes or grows a book. Sleep binds leftover conversation. Nightly dreaming builds the graph and births ridge keepers from what keeps returning. Unattended.
Asks clarifying questions, takes notes, captures feedback	Covered	Ask replies end with a follow-up question. Passing remarks land dated in the keeper's notes book. Ridge keepers reflect and ask one real question back.
Autonomous action, not only chat (judges reward this)	Covered	Dreaming is Pub/Sub + Cloud Scheduler. Tired keepers publish. The island consolidates while the user is away. That is the autonomous pass.

JUDGING CRITERIA (1 TO 5 PER CRITERION, BONUSES LIFT THE FINAL TO 6)

CRITERION	WEIGHT	HOW THE WORK ANSWERS IT
Innovation and operational utility	40%	Memories scatter across life. The product is not a chatbot: keepers write books, answers are grounded, night builds a knowledge graph and names what you avoid. Dreaming is the high-value action that runs without hand-holding.
Architectural discipline and tech stack	30%	Boxes with contracts. ADK AgentTool, not transfer, so the root can synthesize. Firestore owns libraries and sessions (worlds, keepers, books, session, dreams). Dreaming is a Pub/Sub delivery run in-request and retried by the subscription. Runs are bounded (12 model calls, stop on a repeated call), every flow has a deterministic fallback. Meters, caps, island key, deploy token, billing detach.
Demo and production readiness	30%	Hosted Cloud Run URL. README spin-up from zero and docker compose locally. This architecture diagram. Contract tests on the real FastAPI app and ADK runner. Video must still show Console, Vertex logs, and the .run URL.

WHAT TO SUBMIT

FIELD	STATUS	WHERE
Category	Chosen	The Collaborative Partner
Hosted project URL	Live	Cloud Run, europe-west1, serving 0.9; island key in the Devpost testing credentials
Text description	Written	README + Devpost About
Code repository	Public	github.com/hec-ovi/memory-keepers
Spin-up instructions in README.md	Present	Run locally (compose) and Deploy to Google Cloud (gcloud / Cloud Shell)
Architecture diagram	This file	How Gemini, ADK, Cloud Run, Firestore, Pub/Sub, speech, and Gemma connect
Demo video, max 4 min, live app, Google Cloud backend visible, name Gemini + ADK	Published	3:35, narrated, public: youtu.be/2m9c1UvCAa

BONUS POINTS (1.0 CAP)

BONUS	POINTS	STATUS
Additional Google AI models, 0.2 each, 0.6 cap. Rules name Gemma; "such as" is not a closed list	0.6	Integrated: Gemma (named), Cloud Text-to-Speech, Cloud Speech-to-Text. Gemini 3.5 is the required model, not a bonus
Public blog, podcast, or video that says it was created for entering this hackathon	0.2	Not published yet
Social post with #AllThingsAgenticHackathon on X or LinkedIn	0.2	Not posted yet

Gemma is the bonus the rules name. TTS and STT are Google AI models used end to end; whether judges count them is their call. They are in the product either way (hold T, spoken replies).

THE TWIST, PER TRACK (RULES PAGE, INNOVATION CRITERION)

PUBLISHED TWIST	HOW IT SHOWS UP HERE
Collaborative Partner (this track): synthesize or mutate data rather than read it; ingest messy, unstructured streams	Sources become authored books; dreaming turns cross-shelf patterns into ridge keepers and a knowledge graph. Streams: YouTube and podcast transcripts, lyrics, film plots, spoken input.
